# 1 Introduction

EMM Consulting Pty Limited (EMM) was engaged to complete operator-attended noise surveys on behalf of Great Southern Energy Pty Ltd (Delta Coal).

The purpose of the monitoring was to address requirements of the Mannering Colliery Noise Management Plan (NMP), prepared to satisfy the requirements of the project approval MP06\_0311 (PA) and Environment Protection License (EPL) 191. It is of note that Modification 5 of the site PA (Mod 5 approval) was approved by the NSW Department of Planning, Industry and Environment (DPIE) in June 2020, and Delta Coal have revised the NMP which has been submitted to DPIE for approval to reflect any changes to, or additional, operational noise conditions. It is noted that the revised NMP incorporates noise management for both Delta Coal's Chain Valley Colliery and Mannering Colliery.

Noise monitoring is required to occur on a monthly basis for Mannering Colliery. This report presents the results and findings of attended noise monitoring conducted on 8 November 2021.

The following material was referenced as part of this assessment:

- DPIE, PA MP06\_0311, as modified on 5 June 2020 (current as of the monitoring date 8 November 2021);
- Environment Protection Authority (EPA), EPL 191, as varied on 14 April 2021 (current as of the monitoring date 8 November 2021);
- NSW EPA, Industrial Noise Policy (INP), 2000;
- NSW EPA, Noise Policy for Industry (NPfl), 2017;
- Mannering Colliery Noise Management Plan (currently approved NMP), updated following Mannering Colliery Modification 4 approval (Mod 4 approval) (approved by DPIE 4 December 2019); and
- Chain Valley Colliery and Mannering Colliery Noise Management Plan (revised NMP DPIE approval pending), updated following Mannering Colliery Mod 5 approval.

The noise limits in the revised NMP (Mod 5) are more stringent than those provided in the currently approved NMP (Mod 4) and hence have been adopted for the monitoring undertaken on 8 November 2021). This includes the +5 dB adjustment to noise limits during 'very noise-enhancing' meteorological conditions in accordance with NPfI, as stated in the PA and revised NMP. This is discussed further in Section 2.

A glossary of acoustic terms relevant to this report is provided in Appendix A.

# 2 Noise limits

# 2.1 Overview

Mannering Colliery noise limits are provided in Table 1, Condition 2 of Schedule 3 of the PA. The EPL references the PA with respect to noise limits. Extracts of the relevant sections of the PA and EPL pertaining to noise are provided in Appendix B and Appendix C, respectively.

The currently approved NMP was prepared in line with the Mod 4 approval and in accordance with the INP (superseded noise policy). Delta Coal have revised the NMP to reflect any changes to or additional operational noise conditions from the Mod 5 approval. The noise assessment locations in the PA have not changed following the Mod 5 approval and hence the three attended noise monitoring locations adopted in the currently approved NMP for the purpose of determining compliance remain representative of the noise assessment locations outlined in the PA. The noise limits in the PA (Mod 5) are generally more stringent than those in the Mod 4 approval and the currently approved NMP.

# 2.2 Adopted noise limits

As the noise limits in the revised NMP (DPIE approval pending) are more stringent than those outlined in the currently approved NMP, the noise limits from the revised NMP have been adopted for this round of noise monitoring.

The Mannering Colliery attended noise monitoring program is undertaken on a monthly basis during the evening and night periods. The attended noise monitoring locations and relevant limits as per the revised NMP are summarised in Table 2.1.

## Table 2.1 Attended noise monitoring locations and noise limits (revised NMP)

| Attended noise<br>monitoring location | Assessment locations | Day<br>L <sub>Aeq,15 minute</sub> , dB | Evening<br>L <sub>Aeq,15 minute</sub> , dB | Night<br>L <sub>Aeq,15 minute</sub> , dB | Night<br>L <sub>A1,1 minute</sub> , dB |
|---------------------------------------|----------------------|--|--|--|--|
| RA1                                   | 4, 5, 6              | 40                                     | 36   | 36                                       | 46                                     |
| RA2                                   | 7,8                  | 40                                     | 40   | 40                                       | 45                                     |
| RA3                                   | 9, 11, 18, 20        | 40                                     | 39   | 39                                       | 49                                     |

For this assessment, the recorded  $L_{Amax}$  has been used as a conservative estimate of the  $L_{A1,1 \text{ minute}}$ . The EPA accepts sleep disturbance analysis based on either the  $L_{A1,1 \text{ minute}}$  or  $L_{Amax}$  metrics, with the  $L_{Amax}$  resulting in a more conservative assessment of site noise emissions.

# 2.3 Adjustment to noise limits under certain meteorological conditions

The currently approved NMP specifies the following meteorological conditions under which noise limits do not apply:

- wind speeds greater than 3 m/s at 10 m above ground level;
- stability category F temperature inversion conditions with wind speeds greater than 2 m/s at 10 m above ground level; or

• stability category G temperature inversion conditions.

However, the PA (Mod 5) states the following:

Noise generated by the development must be monitored and measured in accordance with the relevant procedures and exemptions (including certain meteorological conditions) of the NSW Noise Policy for Industry (EPA, 2017).

Section 5.2 of the NPfI states that noise limits applicable under 'very noise-enhancing' conditions (as listed above) should be the limits that apply under 'standard' or 'noise-enhancing' conditions plus 5 dB. This implies that there will be no periods when noise limits do not apply due to meteorological conditions. As per Fact Sheet D of the NPfI, 'standard' or 'noise-enhancing' conditions are defined as follows:

Standard meteorological conditions – Day/evening/night: stability categories A-D with wind speed up to 0.5 m/s at 10 m above ground level.

Noise-enhancing meteorological conditions – Day/evening: stability categories A-D with wind speed up to 3 m/s at 10 m above ground level. Night: stability categories A-D with wind speed up to 3 m/s at 10 m above ground level and/or stability category F with wind speed up to 2 m/s at 10 m above ground level.

Therefore, as per the PA (Mod 5) and revised NMP and in accordance with the NPfI, this assessment has adopted a +5 dB adjustment to the limits shown in Table 2.1 when monitoring is undertaken during 'very noise-enhancing' conditions (ie outside the 'standard' and 'noise-enhancing' conditions). This is indicated in Table 4.1 where relevant.

# 2.4 Low frequency noise

Fact sheet C of the NPfI provides guidelines for applying modifying factor adjustments to account for low frequency noise emissions. The NPfI specifies that a difference of 15 dB or more between site 'C-weighted' and site 'A-weighted' noise emission levels identifies the potential for an unbalanced noise spectrum and potential increased annoyance at a residential receiver.

Where a difference of 15 dB or more between site 'C-weighted' and site 'A-weighted' noise emission levels is identified, the one-third octave noise levels recorded should be compared to the low frequency noise threshold values in Table C2 of the NPfI, which has been reproduced in Table 2.2.

### Table 2.2 One-third octave low frequency noise threshold levels

| One-third octave Lzeq,15 minute threshold levels |    |      |    |    |    |      |    |    |    |    |     |     |     |
|--|----|------|----|----|----|------|----|----|----|----|-----|-----|-----|
| Frequency (Hz)                                   | 10 | 12.5 | 16 | 20 | 25 | 31.5 | 40 | 50 | 63 | 80 | 100 | 125 | 160 |
| dB (Z)   | 92 | 89   | 86 | 77 | 69 | 61   | 54 | 50 | 50 | 48 | 48  | 46  | 44  |

The following modifying factor adjustments for low frequency noise are to be applied to the site  $L_{Aeq,15 minute}$  noise contribution where the site 'C-weighted' minus site 'A-weighted' noise emission level is found to be 15 dB or more and:

• where any of the one-third octave noise levels in Table 2.2 are exceeded by up to and including 5 dB and cannot be mitigated, a 2 dB positive adjustment to measured/predicted A-weighted levels applies for the evening/night period; or

• where any of the one-third octave noise levels in Table 2.2 are exceeded by more than 5 dB and cannot be mitigated, a 2 dB positive adjustment to measured/predicted A-weighted levels applies for the day period and a 5 dB positive adjustment to measured/predicted A-weighted levels applies for the evening/night period.

Hence, where possible throughout each survey, the operator has estimated the difference between site 'C-weighted' and site 'A-weighted' noise emission levels by matching audible sounds with the response of the sound analyser ( $L_{Ceq}-L_{Aeq}$ ). Where this was found to be 15 dB or greater, the measured one-third octave frequencies have been compared to the threshold values in Table 2.2 to identify the relevant modifying factor adjustment (if applicable). This method for the application of modifying factors for low frequency noise has been adopted for this assessment as discussed in Section 4.

It is of note that low frequency noise adjustments only apply under the 'standard' or 'noise-enhancing' meteorological conditions in accordance with Fact sheet C of the NPfI. Refer to Section 2.3 for the definitions of 'standard' and 'noise-enhancing' meteorological conditions.

# 3 Assessment methodology

# 3.1 Attended noise monitoring

To quantify noise emissions from Mannering Colliery, 15-minute operator-attended noise monitoring surveys were completed at three representative locations as per the revised NMP.

Attended noise monitoring locations and their coordinates are listed in Table 3.1 and are shown in Figure 3.1.

### Table 3.1 Attended noise monitoring locations

| Attended noise      | Description   | Coordinates (MGA56) |          |  |  |
|---------------------|---|---------------------|----------|--|--|
| monitoring location |   | Easting             | Northing |  |  |
| RA1                 | Pacific Highway, Doyalson                           | 364646              | 6327221  |  |  |
| RA2                 | Macquarie Shores Home Village, Doyalson North       | 365164              | 6328332  |  |  |
| RA3                 | Tall Timbers Road (northern end), Kingfisher Shores | 365069              | 6328953  |  |  |

The attended noise monitoring consisted of two 15-minute operator-attended noise monitoring surveys at each of the monitoring locations (ie RA1, RA2 and RA3), one survey during the evening period and one survey during the night period as per the revised NMP.

As per the revised NMP, attended noise monitoring is scheduled considering the occurrence of regular operations at Mannering Colliery. Noise monitoring is generally planned to avoid scheduled down-time or maintenance. Regular operations (ie coal production) were occurring during the entire monitoring period, as confirmed by Delta Coal.

# 3.2 Instrumentation

A Brüel & Kjær 2250 Type 1 sound analyser (s/n 2759405) was used to conduct 15-minute attended measurements and record one-third octave frequency and statistical noise indices. The sound analyser was calibrated before and on completion of the surveys using a Svantek SV36 sound level calibrator (s/n 79952). Instrumentation calibration certificates are provided in Appendix D.

Where possible throughout each survey, the operator has quantified the contribution of site noise and other significant noise sources. This was done by matching audible sounds with the response of the sound analyser (where applicable) and/or via post-analysis of data (eg low-pass filtering).

# 3.3 Determination of stability categories

For the purpose of this assessment and as required by the revised NMP, atmospheric stability categories were determined for each 15-minute attended monitoring period. The stability category data as well as the average wind data (speed and direction) for the monitoring period were obtained from Mannering Colliery's meteorological station located to the north of the site (refer to Figure 3.1).

The stability categories and associated ranges in temperature lapse rates are presented in Table 3.2.

### Table 3.2 Stability categories and temperature lapse rates

| Stability category | Temperature lapse rate (ΔT) (°C/100 m) |  |  |  |  |  |
|--------------------|--|--|--|--|--|--|
| A                  | ΔT < -1.9                              |  |  |  |  |  |
| В                  | -1.9 ≤ ΔT < -1.7                       |  |  |  |  |  |
| С                  | -1.7 ≤ ΔT < -1.5                       |  |  |  |  |  |
| D                  | -1.5 ≤ ΔT < -0.5                       |  |  |  |  |  |
| E                  | -0.5 ≤ ΔT < 1.5                        |  |  |  |  |  |

# 4 Review of data and discussion

Results of attended noise measurements are summarised in Table 4.1. Mannering Colliery noise contribution was determined for each survey using in-field observations and post-analysis of data as required (eg removing higher frequencies that are not mine related where applicable). Attended noise monitoring was completed during the evening and night periods on 8 November 2021.

The meteorological data for the monitoring period was sourced from Mannering Colliery's meteorological station to determine applicability of the noise limits in accordance with the revised NMP. Meteorological conditions were 'standard' or 'noise-enhancing' at the time of the monitoring and, in accordance with the revised NMP, the standard noise limits shown in Table 2.1 applied for all six 15-minute attended noise measurements.

Site noise was inaudible during two of the six measurements during the evening and night measurements at RA1. Typically, when a particular source is not audible above local ambient noise levels, the likely contribution of that source is at least 10 dB below the measured background ( $L_{A90}$ ) level. The measured  $L_{A90,15 \text{ minute}}$  noise level was no greater than 10 dB above the relevant  $L_{Aeq,15 \text{ minute}}$  limit during these measurements at RA1. Therefore, the site  $L_{Aeq,15 \text{ minute}}$  noise contributions during these measurements are considered to have satisfied the relevant noise limits.

Where site noise was audible, site noise contributions satisfied the relevant noise limits.

Low frequency noise was assessed by comparing the site one-third octave noise levels to the NPfI one-third octave LFN thresholds when the site was audible. In accordance with the NPfI, LFN modifying factors were found to be not relevant at any of the locations.

Mannering Colliery noise contributions ( $L_{Aeq,15 minute}$  and  $L_{Amax}$ ) were determined to have satisfied the more stringent noise limits (as provided in the Mod 5 approval) at all locations for this round of noise monitoring, as per the revised NMP.

#### Table 4.1Mannering Colliery attended noise monitoring results – November 2021

Notes: 1. Modifying factor in accordance with Fact sheet C of the NPfl (refer to Section 2.4).

2. For assessment purposes the  $L_{Amax}$  and the  $L_{A1,1 minute}$  are interchangeable.

3. Meteorological data including wind speed, wind direction and stability category (SC) were taken as an average over 15 minutes from Mannering Colliery weather station (refer to Section 3.3). 4. As per the revised NMP (pending DPIE approval).

5. IA = inaudible.

6. N/A = not applicable.

# 5 Conclusion

EMM has completed a review of mine noise from Mannering Colliery within the surrounding community based on attended measurements conducted on 8 November 2021.

The meteorological data for the monitoring period was sourced from Mannering Colliery's meteorological station to determine applicability of the noise limits in accordance with the revised NMP. Meteorological conditions were 'standard' or 'noise-enhancing' at the time of the monitoring and, in accordance with the revised NMP, the standard noise limits applied for all six 15-minute attended noise measurements.

The assessment of noise contributions from site included consideration of modifying factors for certain noise characteristics, such as low frequency noise, in accordance with the NPfI. Modifying factors were found to be not relevant at all monitoring locations.

Mannering Colliery noise contributions satisfied the relevant noise limits at all locations as per the revised NMP.

# **Glossary of acoustic terms**

Several technical terms are discussed in this report. These are explained in Table A.1.

### Table A.1Glossary of acoustic terms

| Term                  | Description  |
|-----------------------|--|
| dB                    | Noise is measured in units called decibels (dB). There are several scales for describing noise, the most common being the 'A-weighted' scale. This attempts to closely approximate the frequency response of the human ear.                                    |
| L <sub>A1</sub>       | The 'A-weighted' noise level which is exceeded 1% of the time.   |
| LA1,1 minute          | The 'A-weighted' noise level exceeded for 1% of the specified time period of 1 minute.   |
| L <sub>A10</sub>      | The 'A-weighted' noise level which is exceeded 10% of the time. It is approximately equivalent to the average of maximum noise level.  |
| L <sub>A90</sub>      | Commonly referred to as the background noise level. The 'A-weighted' noise level exceeded 90% of the time.   |
| L <sub>Aeq</sub>      | The energy average noise from a source. This is the equivalent continuous 'A-weighted' sound pressure level over a given period. The L <sub>Aeq,15 minute</sub> descriptor refers to an L <sub>Aeq</sub> noise level measured over a 15-minute period.         |
| L <sub>Amin</sub>     | The minimum 'A-weighted' noise level received during a measuring interval.   |
| L <sub>Amax</sub>     | The maximum root mean squared 'A-weighted' sound pressure level (or maximum noise level) received during a measuring interval.   |
| L <sub>Ceq</sub>      | The equivalent continuous 'C-weighted' sound pressure level over a given period. The L <sub>Ceq,15 minute</sub> descriptor refers to an L <sub>Ceq</sub> noise level measured over a 15 minute period. C-weighting can be used to measure low frequency noise. |
| Day period            | Monday – Saturday: 7 am to 6 pm, on Sundays and Public Holidays: 8 am to 6 pm.   |
| Evening period        | Monday – Saturday: 6 pm to 10 pm, on Sundays and Public Holidays: 6 pm to 10 pm.   |
| Night period          | Monday – Saturday: 10 pm to 7 am, on Sundays and Public Holidays: 10 pm to 8 am.   |
| Temperature inversion | A meteorological condition where the atmospheric temperature increases with altitude.  |

It is useful to have an appreciation of the decibel (dB), the unit of noise measurement. Table A.2 gives an indication as to what an average person perceives about changes in noise levels in the environment.

### Table A.2Perceived change in noise

| Change in sound pressure level (dB) | Perceived change in noise in surrounding environment |  |  |  |
|-------------------------------------|--|--|--|--|
| up to 2                             | not perceptible                                      |  |  |  |
| 3                                   | just perceptible                                     |  |  |  |
| 5                                   | noticeable difference                                |  |  |  |
| 10                                  | twice (or half) as loud                              |  |  |  |
| 15                                  | large change   |  |  |  |
| 20                                  | four times (or quarter) as loud                      |  |  |  |

Examples of common noise levels are provided in Figure A.1.

### Figure A.1 Common noise levels

Appendix B

# **Project approval extract**

### SCHEDULE 3 SPECIFIC ENVIRONMENTAL CONDITIONS

#### NOISE

#### **Construction Noise**

1. The Applicant must ensure that the noise generated by any construction work is managed in accordance with the requirements outlined in the *Interim Construction Noise Guideline* (DECC, 2009).

#### **Operational Noise Criteria**

2. Except for the carrying out of construction works, the Applicant must ensure that the noise generated by the development does not exceed the criteria in Table 1 at any residence<sup>a</sup> on privately-owned land.

| Noise Assessment<br>Location                               | Day<br>LAeq (15 min) | Evening<br>L <sub>Aeq (15 min)</sub> | Night<br>LAeq (15 min) | Night<br>Lat (1 min) |
|--|----------------------|--------------------------------------|------------------------|----------------------|
| 4 – di Rocco   | 40                   | 36                                   | 36                     | 46                   |
| 5 - Keighran   | 40                   | 39                                   | 39                     | 49                   |
| 6 – Swan   | 40                   | 37                                   | 37                     | 47                   |

| 20 – Knight and all other<br>privately-owned<br>residences | 40                   | 36                                   | 36                     | 46                   |

 Table 1:
 Operational noise criteria dB(A)

<sup>a</sup> The Noise Assessment Locations referred to in Table 1 are shown in Appendix 4.

Noise generated by the development must be monitored and measured in accordance with the relevant procedures and exemptions (including certain meteorological conditions) of the *NSW Noise Policy for Industry* (EPA, 2017).

3. The noise criteria in Table 1 do not apply if the Applicant has an agreement with the owner/s of the relevant residence or land to exceed the noise criteria, and the Applicant has advised the Department in writing of the terms of this agreement.

#### **Noise Operating Conditions**

- 3A. The Applicant must:
  - (a) take all reasonable steps to minimise noise from construction and operational activities, including low frequency noise and other audible characteristics, associated with the development;
  - (b) implement reasonable and feasible noise attenuation measures on all plant and equipment that will operate in noise sensitive areas;
  - (c) operate a comprehensive noise management system commensurate with the risk of impact;
  - (d) take all reasonable steps to minimise the noise impacts of the development during noise-enhancing meteorological conditions when the noise criteria in this consent do not apply (see NPfI);
  - (e) carry out regular attended noise monitoring (at least once a month, unless otherwise agreed by the Planning Secretary) to determine whether the development is complying with the relevant conditions of this consent;

### **NSW Government**

Department of Planning, Industry and Environment

- (f) regularly assess the noise monitoring data and modify or stop operations on the site to ensure compliance with the relevant conditions of this consent; and
- (g) implement reasonable and feasible measures to further enclose the structure housing the coal crusher in order to further mitigate noise from operational activites.
- 3B. The Applicant must decommission the surface rotary breaker identified in the Statement of Commitments at Appendix 3, within 3 months of approval of Modification 5.

#### **Noise Management Plan**

- 3C. The Applicant must prepare a Noise Management Plan for the development to the satisfaction of the Planning Secretary. This plan must:
  - (a) be prepared by a suitably qualified and experienced person/s whose appointment has been endorsed by the Planning Secretary;
  - (b) describe the measures to be implemented to ensure:
    - i. compliance with the noise criteria and operating conditions in this consent;
    - ii. best practice management is being employed; and
    - iii. noise impacts of the development are minimised during noise-enhancing meteorological conditions when the noise criteria in this consent do not apply (see NPfI);
  - (c) describe the noise management system in detail; and
  - (d) include a monitoring program that:
    - i. uses a combination of real-time and supplementary attended monitoring to evaluate the performance of the development;
    - ii. monitors noise at the nearest and/or most affected residences;
    - iii. includes a program to calibrate and validate the real-time noise monitoring results with the attended monitoring results over time;
    - iv. adequately supports the noise management system;
    - v. includes a protocol for distinguishing noise emissions of the development from any neighbouring developments; and
    - vi. includes a protocol for identifying any noise-related exceedance, incident or non-compliance and for notifying the Department and relevant stakeholders of any such event.

The Applicant must implement the Noise Management Plan as approved by the Planning Secretary.

#### SUBSIDENCE

4. The Applicant must limit its coal extraction methods on the site to first workings only, and must not undertake second workings.

#### 5. Deleted.

#### SOIL AND WATER

#### Discharge

- 6. The Applicant must only discharge water from the site as expressly provided for by its EPL.
- 7. The Applicant must investigate, assess and report on the ecological interactions of minewater discharged from the site with the aquatic ecology of the unnamed creek and wetlands (and associated vegetation) between the minewater discharge point/s and Lake Macquarie. This report must:
  - (a) be prepared in consultation with EPA by suitably qualified expert/s whose appointment/s have been approved by the Planning Secretary;
  - (b) be submitted to the Planning Secretary by the end of March 2009; and
  - (c) assess the probable alterations in the local ecology attributable to previous and proposed minewater discharges and any future cessation of minewater discharge flows.

#### Water Management Plan

- 8. The Applicant must prepare a Water Management Plan for the development to the satisfaction of the Planning Secretary. This plan must:
  - (a) be prepared in consultation with DPIE Water by suitably qualified expert/s whose appointment/s have been approved by the Planning Secretary;
  - (b) be submitted the Planning Secretary by the end of March 2009; and
  - (c) include a:
    - Site Water Balance;

#### **NSW Government**

Department of Planning, Industry and Environment

Appendix C

# **Environment Protection Licence**

Licence - 191

L4.1 The licensee must not cause, permit or allow any waste to be received at the premises, except the wastes expressly referred to in the column titled "Waste" and meeting the definition, if any, in the column titled "Description" in the table below.

Any waste received at the premises must only be used for the activities referred to in relation to that waste in the column titled "Activity" in the table below.

Any waste received at the premises is subject to those limits or conditions, if any, referred to in relation to that waste contained in the column titled "Other Limits" in the table below.

This condition does not limit any other conditions in this licence.

| Code | Waste                                 | Description  | Activity  | Other Limits |
|------|---------------------------------------|--|---|--------------|
| NA   | Waste                                 | Any other waste<br>received on the<br>premises for storage,<br>treatment, processing,<br>sorting or disposal and<br>which receipt is not a<br>scheduled activity under<br>Schedule 1 of the<br>POEO Act, as in force<br>from time to time. |   |              |
| NA   | General or Specific<br>exempted waste | Waste that meets all the<br>conditions of a resource<br>recovery exemption<br>under Clause 51A of the<br>Protection of the<br>Environment Operations<br>(Waste) Regulation<br>2014   | As specified in each<br>particular resource<br>recovery exemption | N/A          |

- L4.2 The licensee must not cause, permit or allow any waste generated outside the premises to be received at the premises for storage, treatment, processing, reprocessing or disposal or any waste generated at the premises to be disposed of at the premises, except as expressly permitted by the licence.
- L4.3 This condition only applies to the storage, treatment, processing, reprocessing or disposal of waste at the premises if it requires an environment protection licence.

# L5 Noise limits

Note: Noise limits are not specified as a condition of this licence. Noise limits are prescribed with the conditions of Project Approval 06\_0311 granted under the *Environmental Planning and Assessment Act 1979*. Under the *Environmental Planning and Assessment Act 1979* the Department of Planning is the appropriate authority in respect of the administration and regulation of the Project Approval.

# 4 Operating Conditions

# O1 Activities must be carried out in a competent manner

O1.1 Licensed activities must be carried out in a competent manner.
